Life expectancy

Healthy life expectancy

Life expectancy at birth

The average number of years that a newborn could expect to live. United States of America, by sex, 2000 - 2021.

[Download data](#)

In the United States of America, **life expectancy at birth (years)** has **worsened by ▼ 0.285 years** from 76.7 [76.6 - 76.7] years in 2000 to **76.4** [76.3 - 76.5] years in 2021.

Life expectancy at birth - region / global

The average number of years that a newborn could expect to live. United States of America, 2000 - 2021

[Download data](#)

In the Americas, **life expectancy at birth (years)** has **improved by ▲ 0.0261 years** from 74.1 [74 - 74.3] years in 2000 to **74.1** [73.9 - 74.4] years in 2021.

Healthy life expectancy (HALE) at birth

The average number of years that a person can expect to live in “full health” from birth. United States of America, by sex, 2000 - 2021.

In the United States of America, **healthy life expectancy at birth (years)** has **worsened by ▼ 1.41 years** from 65.3 [64.6 - 66.1] years in 2000 to **63.9** [63.1 - 64.7] years in 2021.

In the Americas, **healthy life expectancy at birth (years)** has **worsened by ▼ 0.318 years** from 63.6 [63 - 64.3] years in 2000 to **63.2** [62.6 - 63.9] years in 2021.

What is the difference between life expectancy and healthy life expectancy?

"Life expectancy" refers to the number of years a person can expect to live. It is an important way of assessing the health of a population and is used to inform health policy and initiatives that impact everyday life.

"Life expectancy at birth" is the average number of years that a newborn could expect to live, (the average age of death) while "Healthy life expectancy (HALE) at birth" is the average number of years that a person could expect to live in "full health" from birth. This measurement takes into account years lived in less than full health due to disease and/or injury.

* The lack of complete and reliable mortality data, especially for low income countries and particularly on mortality among adults and the elderly, necessitates the application of modelling to estimate life expectancy. This may lead to minor differences compared with official life tables prepared by Member States.

Leading causes of death, United States of America

Top causes of death - Female

Deaths per 100 000 population. United States of America, 2021

Ischaemic heart disease	123.4	
Alzheimer disease and other dementias	111.7	
COVID-19	107.5	
Stroke	57.8	
Chronic obstructive pulmonary disease	51.3	
Trachea, bronchus, lung cancers	37.6

Why and how are causes of death monitored?

Understanding the reasons why people die helps with the understanding of how they lived, in order to improve health services and reduce preventable deaths in every country, responding effectively to changing circumstances. Annual monitoring of causes of death allows countries to address their causes and adapt health systems to react effectively.

The leading causes of death are statistical estimates based on available data. These estimates are produced using data from multiple sources, including national vital registration data, latest estimates from WHO technical programmes, United Nations partners and inter-agency groups, as well as the Global Burden of Disease and other scientific studies. Before publishing, they are reviewed by WHO Member States through consultation with national focal points and WHO country and regional offices.

The top ten causes of death are statistical estimates based on available data. Multiple years of national death registration data with high completeness and quality of cause-of-death assignment is available for United States of America. These estimates may be compared among countries and used for priority setting and policy evaluation.

Health target progress, United States of America

WHO Triple billion targets →

Healthier Populations

In the United States of America, the number of additional people expected to be enjoying better health and wellbeing is projected to be 6m (-2.4m - 14.4m) by 2025 compared to 2018.

United States of America, 2018 - 2025

Universal Health Coverage

In the United States of America, the number of additional people expected to be covered by essential services and not experiencing financial hardship is projected to be 10.9m (3.1m – 18.2m) by 2025 compared to 2018.

United States of America, 2018 - 2025

Health Emergencies Protection

In the United States of America, the number of additional people expected to be protected from health emergencies is projected to be -21.1m (-48.2m - 2.5m) by **2025** compared to 2018.

United States of America, 2018 - 2025

What are the triple billion targets?

The WHO Triple Billion targets measure impact on people's health to ensure that more people are enjoying better health and wellbeing, are benefitting from Universal Health Coverage (UHC) and are better protected from health emergencies.

The estimates are underpinned by 46 outcome indicators. They include 39 Sustainable Development Goal (SDG) indicators and seven non-SDG indicators. These offer a flexible approach to each of the Triple Billion targets, allowing countries to prioritize certain indicators based on their national health strategy, ensuring the Triple Billion strategy remains relevant for all Member States and their unique health challenges.
